A Wooly Bully Itch? (Yes, a wooly bully itch). A woolly itch (Erythraea graminis) is an insect that occurs on the head of a person, this species is known to attack humans while they sleep. A woolly itch can cause significant discomfort and scratching. The symptoms of this condition include intense itching and redness, with small red bumps or small white nodules on the skin. In some cases, these nodules can become infected. The best treatment for a woolly itch is to consult a doctor or dermatologist, who may prescribe topical medications or antihistamines to help relieve the symptoms.
